OSCAR HERNANDEZ, JR. D.M.D.

Bone Graft Refusal

I understand that when a tooth is extracted, the underlying bone will atrophy (shrink). Bone grafting is a method to reduce or offset this bone atrophy after extraction(s), or to supplement bone around an implant. It is now considered standard of care for routine extractions.

I have been informed of the doctor's recommendation of bone grafting for the preservation of my own periodontal bone and improved healing post-extraction. A bone graft procedure will allow for the best likelihood of implant success and improved aesthetics.

I have discussed my treatment with my doctor and have been given an opportunity to ask questions, all of which have been fully answered. I understand the nature and risks of recommended treatment, alternate treatment options, and the potential consequences of refusal of care.

I, _____ **DO NOT wish to proceed with the recommended treatment.**
